

CMOS 4-BIT MICROCONTROLLER

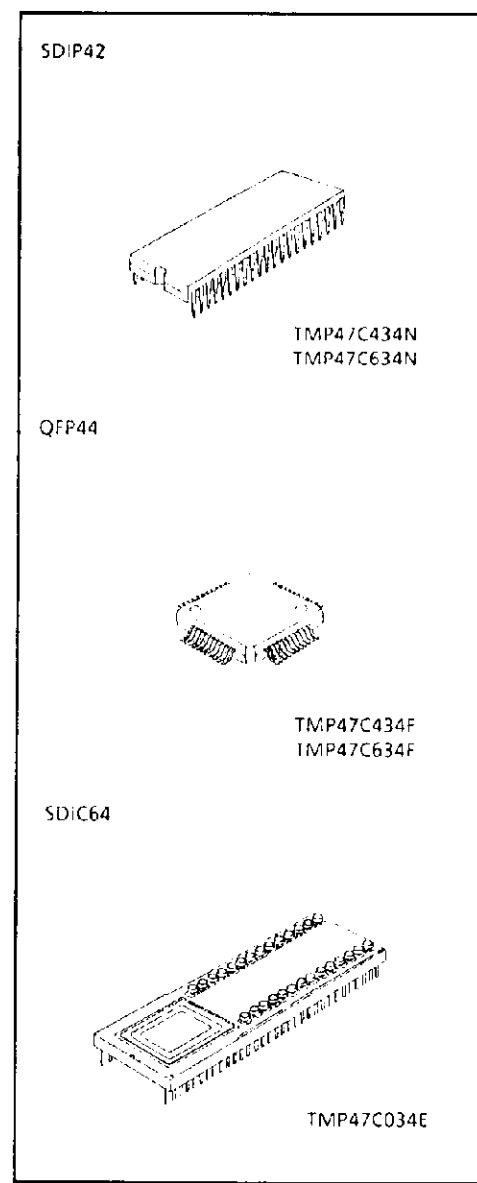

**TMP47C434N, TMP47C634N
TMP47C434F, TMP47C634F**

The 47C434/634 are based on the TLCS-470 CMOS series. The 47C434/634 have on-screen display circuit to display characters and marks which indicate channel or time on TV screen, A/D converter input, and D/A converter output.

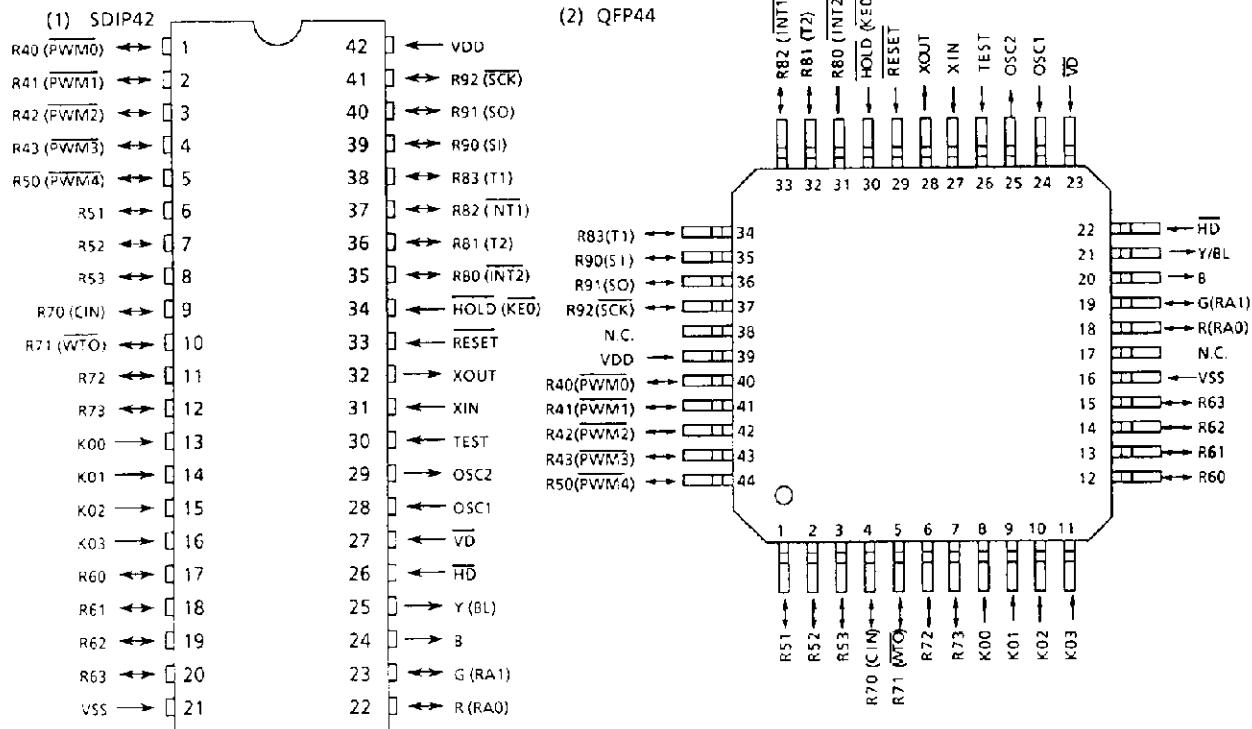

PART No.	ROM	RAM	PACKAGE	PIGGYBACK (adapter socket)
TMP47C434N TMP47C434F	4096 x 8-bit	256 x 4-bit	SDIP42 QFP44	TMP47C034E (BM1105)
TMP47C634N TMP47C634F	6144 x 8-bit	384 x 4-bit	SDIP42 QFP44	TMP47C034E (BM1105)

FEATURES

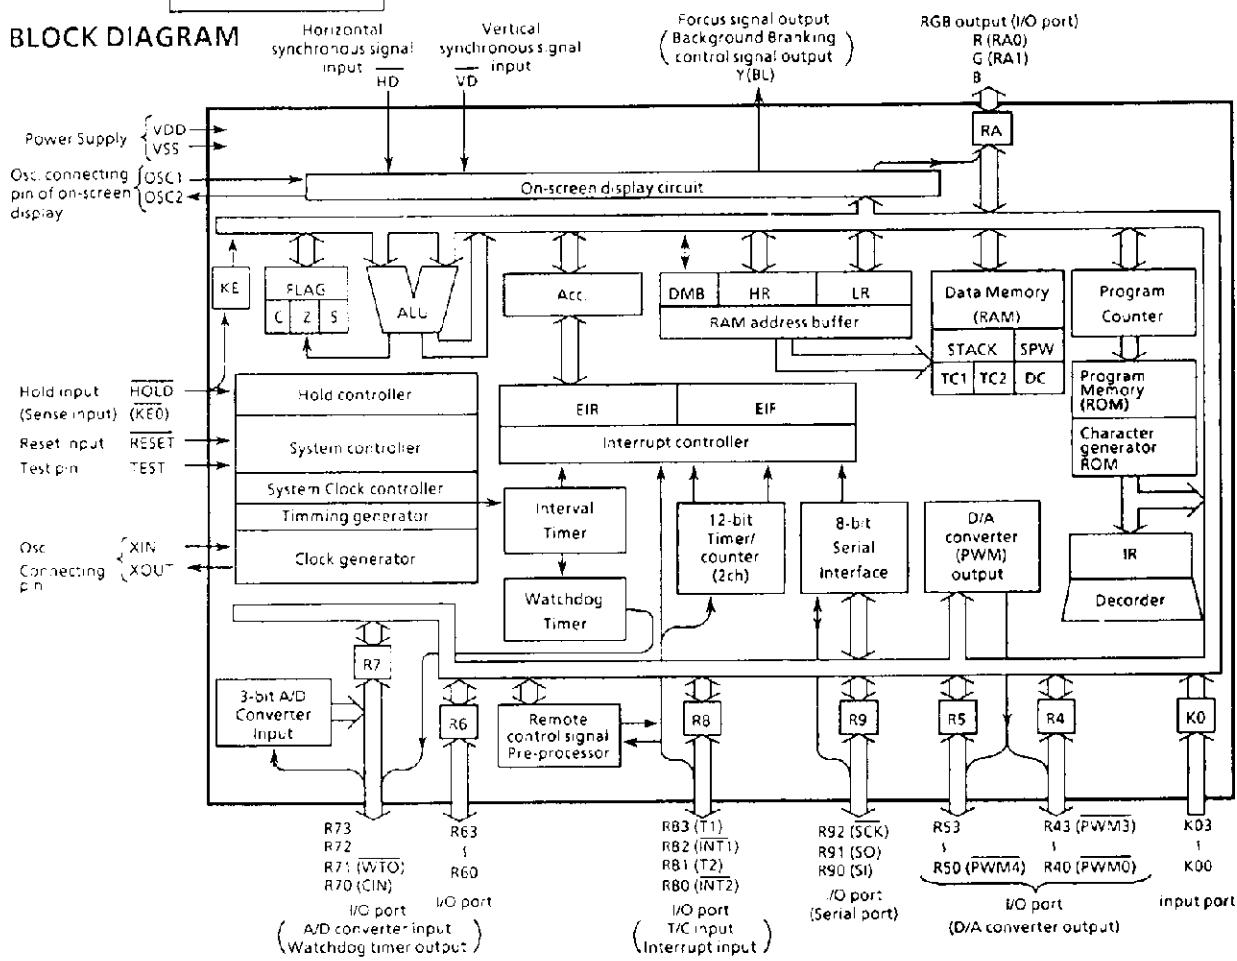

- ◆ 4-bit single chip microcomputer
- ◆ Instruction execution time : 1.9µs (at 4.2 MHz)
- ◆ 92 basic instructions
- ◆ Table look-up instructions
- ◆ Subroutine nesting : 15 levels max.
- ◆ 6 interrupt sources (External : 2, Internal : 4)
 - All sources have independent latches each, and multiple interrupt control is available
- ◆ I/O port (30 pins)
 - Input 2 ports 5 pins
 - I/O 7 ports 25 pins
- ◆ Interval Timer
- ◆ Two 12-bit Timer/Counters
 - Timer, event counter, and pulse width measurement mode
- ◆ Watchdog timer
- ◆ Serial Interface with 8-bit buffer
 - Simultaneous transmission and reception capability
 - External/internal clock, leading/trailing edge shift, 4/8-bit
- ◆ On-screen display circuit
 - Character patterns : 48 characters
 - Characters displayed : 16 columns x 2 lines
 - Composition : 8 x 8 dots (smoothing function)
 - Size of character : 2 kinds (line by line)
 - Color of character : 7 kinds (character by character)
 - Variable display position : horizontal / vertical 64 steps
- ◆ D/A converter (Pulse width modulation) outputs
 - 14-bit resolution 1 channel
 - 6-bit resolution 4 channels
- ◆ 3-bit A/D converter input
 - Auto frequency control signal (S-shaped curve) detection
- ◆ Horizontal synchronous signal is detected by timer/counter
- ◆ Remote control signal preprocessing capability
- ◆ High current outputs
 - LED direct drive capability (typ. 20mA x 4 bits)
- ◆ HOLD function : Battery/Capacitor back-up
- ◆ Real Time Emulator : BM47C834A

PIN ASSIGNMENT (TOP VIEW)

BLOCK DIAGRAM

PIN FUNCTION

PIN NAME	Input/Output	FUNCTIONS	
K03 - K00	input	4-bit input port	
R43 (PWM3) -R41 (PWM1) R40 (PWM0)	I/O (output)	4-bit I/O port with latch. When used as input port or D/A converter outputs pins, the latch must be set to "1".	6-bit D/A converter (PWM) output
R53 - R51			14-bit D/A converter (PWM) output
R50 (PWM4)			6-bit D/A converter (PWM) output
R63 - R60	I/O	4-bit I/O port with latch. When used as input port, the latch must be set to "1".	
R73 - R72	I/O	4-bit I/O port with latch. When used as input port, watchdog timer output pin, or A/D converter input pin, the latch must be set to "1".	Watchdog timer output 3-bit A/D converter input
R71 (WTO)	I/O (output)		
R70 (CIN)	I/O (input)		
R83 (T1) R82 (INT1) R81 (T2) R80 (INT2)	I/O (input)	4-bit I/O port with latch. When used as input port, external interrupt input pin, or timer/counter external input pin, the latch must be set to "1".	Timer/counter 1 external input External interrupt 1 input Timer/counter 2 external input External interrupt 2 input
R92 (SCK)	I/O (I/O)		Serial clock I/O
R91 (SO)	I/O (output)		Serial data output
R90 (SI)	I/O (input)		Serial data input
G (RA1) R (RA0) B	Output (I/O) Output	RGB output	2-bit I/O port with latch. When used as input port, the latch must be set to "1"
Y (BL)			Background blanking control signal output
H _D , V _D	Input	Horizontal synchronous signal input, Vertical synchronous signal input	
OSC1, OSC2	input, output	Resonator connecting pin of on-screen display circuit	
XIN, XOUT	input, output	Resonator connecting pin. For inputting external clock, XIN is used and XOUT is opened.	
RESET	input	Reset signal input	
HOLD (KEÖ)	input (input)	HOLD request/release signal input	Sense input
TEST	input	Test pin for out-going test. Be opened or fixed to low level	
VDD VSS	Power supply	+5V 0V (GND)	

OPERATIONAL DESCRIPTION

Concerning the 47C434/634, the configuration and functions of hardwares are described.

As the description is provided with priority on those parts differing from the 47C660/860, the technical data sheets for the 47C660/860 shall also be referred to.

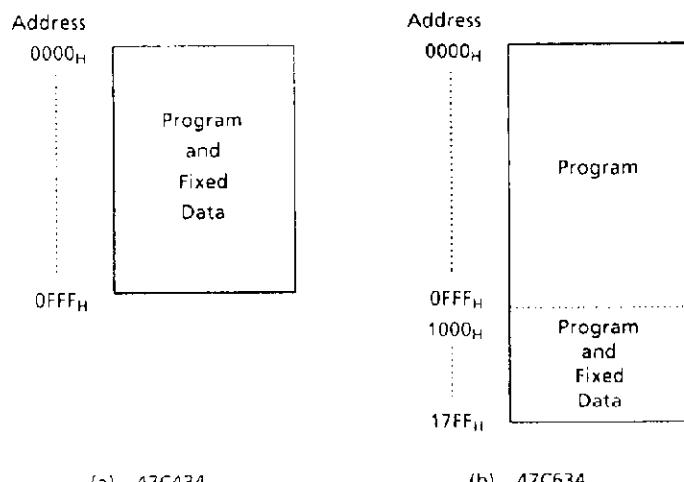

1. SYSTEM CONFIGURATION

- (1) Program Memory (ROM)
- (2) Data Memory (RAM)
- (3) Operation clock changeover control
- (4) I/O Ports
- (5) On-screen display (OSD) control circuit
- (6) A/D converter (comparator) input
- (7) D/A converter (Pulse Width Modulation) output

2. INTERNAL CPU FUNCTION

2.1 Program Memory(ROM)

Programs are stored in address 0000 to 17FF_H of 47C634 and in address 0000 to 0FFF_H of 47C434. By the ROM data reference instruction [LDH A,@DC+, LDL A,@DC], the fixed data in address 1000_H to 17FF_H and 0000 to 0FFF_H can be loaded to the accumulator, respectively.

(a) 47C434

(b) 47C634

Figure 2-1. Program Memory

Note. With the 47C434, permanent data are stored at addresses 0000 – 0FFF_H but, when checking 47C434 operation using a piggy-back chip, it is necessary to store the permanent data to addresses 1000 – 1FFF_H, either.

2.2 Data memory (RAM)

The 47C634 contains 256×4 bits data memory bank 0 (DMB0) and 128×4 bits data memory bank 1 (DMB1). The 47C434 contains 256×4 bits data memory (DMB0). The bank is controlled by DMB.

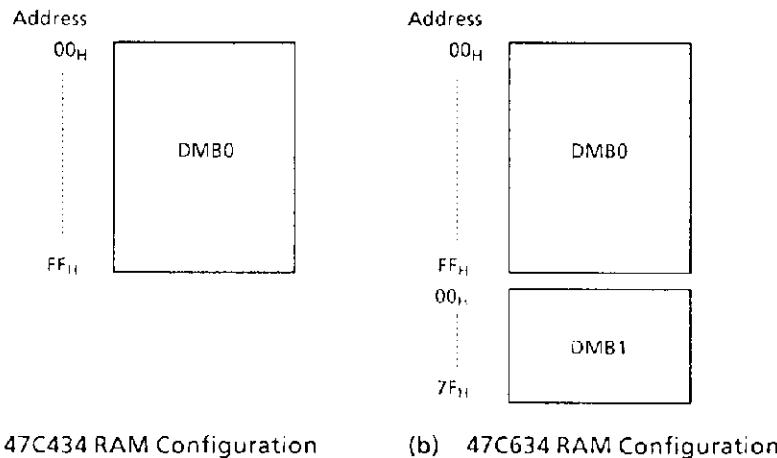

Figure 2-2. Data Memory (RAM)

2.3 Operation clock changeover control

On the 47C434/634 only single clock mode is available. As single clock mode is automatically selected at the initialization, there is no necessary to set system clock control command register (OP16).

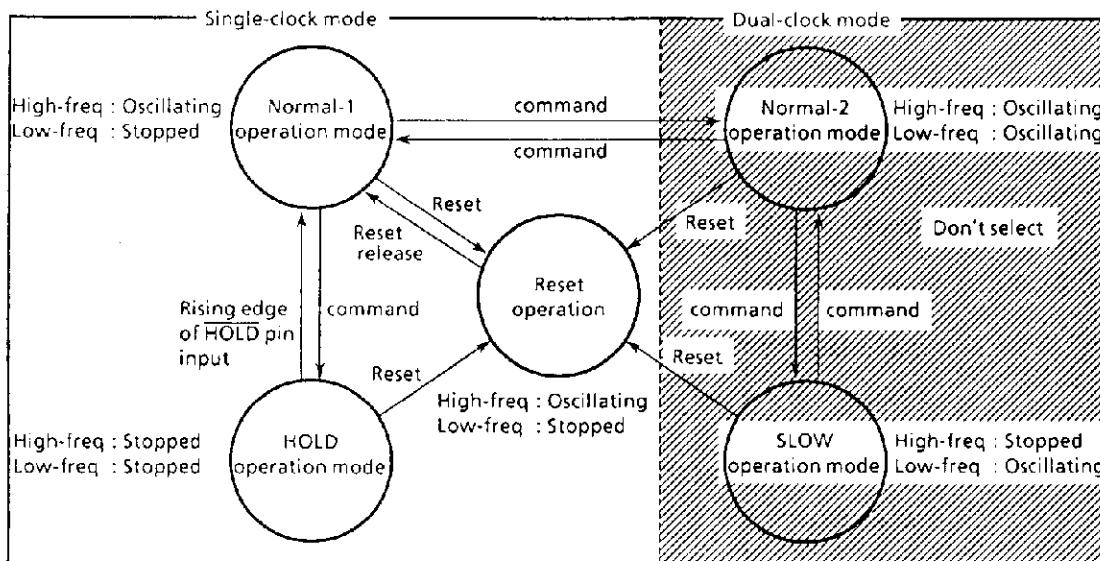

Figure 2-3. Operation Mode Transition Diagram

3. PERIPHERAL HARDWARE FUNCTION

3.1 I/O ports

The 47C434/634 have 9 I/O ports (30 pins) each as follows.

- ① K0 : 4-bit input
- ② R4, R5 : 4-bit input/output (shared with pulse width modulation output)
- ③ R6 : 4-bit input/output
- ④ R7 : 4-bit input/output (shared with comparator input and watchdog timer output)
- ⑤ R8 : 4-bit input/output (shared with external interrupt input and timer/counter input)
- ⑥ R9 : 3-bit input/output (shared with serial port)
- ⑦ RA : 2-bit input/output (shared with on-screen display output)
- ⑧ KE : 1-bit sense input (shared with hold request / release signal input)

This section describes ports of ② and ④, which are changed from the 47C660/860, and it describes port of ⑦, which item of on-screen display circuit.

Table 3-1 lists the port address assignments and the I/O instructions that can access the ports.

(1) Port R4 (R43-R40)

This is a 4-bit I/O port with latch. It is a port common to D/A converter(PWM) output port. R4 port output buffers are Tri-state, and each bit of them can be controlled independently by the program. Controlling the Tri-state is performed by the command register accessed as port address OP00. When some bit of the OP00 is 0, the corresponding bit of the output buffers becomes high impedance state. The output latch should be set to "1" when the port is used as PWM output port, the PWM output should be to "H" level(PWM data is all "0")when the port is used as R 4 port. The output buffers should be set to high impedance state, when the port is used as input port. And the R4 output latch be set to "1", PWM output be set to "High" level, and the output buffer be set to High-Impedance state during reset.

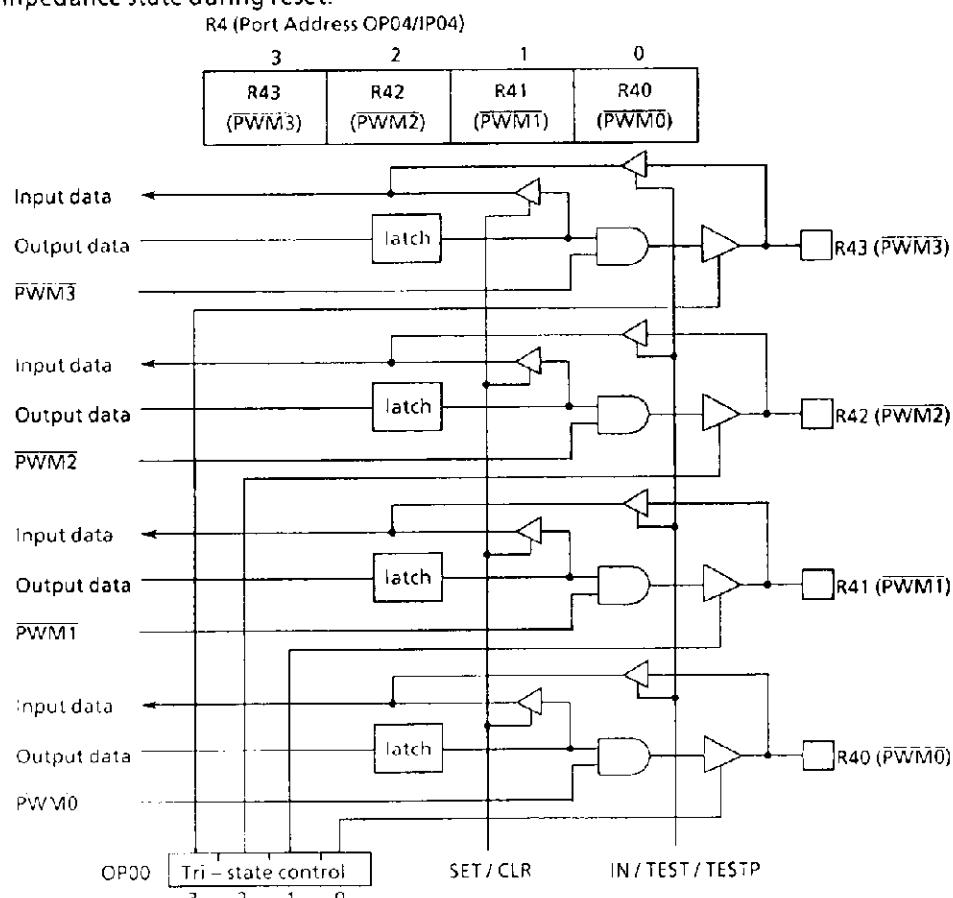

Figure 3-1. Port R4 (PWM)

(2) Port R5 (R53-R50)

The 4-bit I/O port with latch. The only R50 pin share D/A converter (PWM) output. The port output buffers are tri-state, and each bit of them can be controlled independently by the program. Controlling the tri-state is performed by the command register accessed as port address OP13.

```
Example : LD A, #1111B ; OP13←1111B
          OUT A, %OP13
          OUT #05H, %OP05 ; R5 port←5H
```

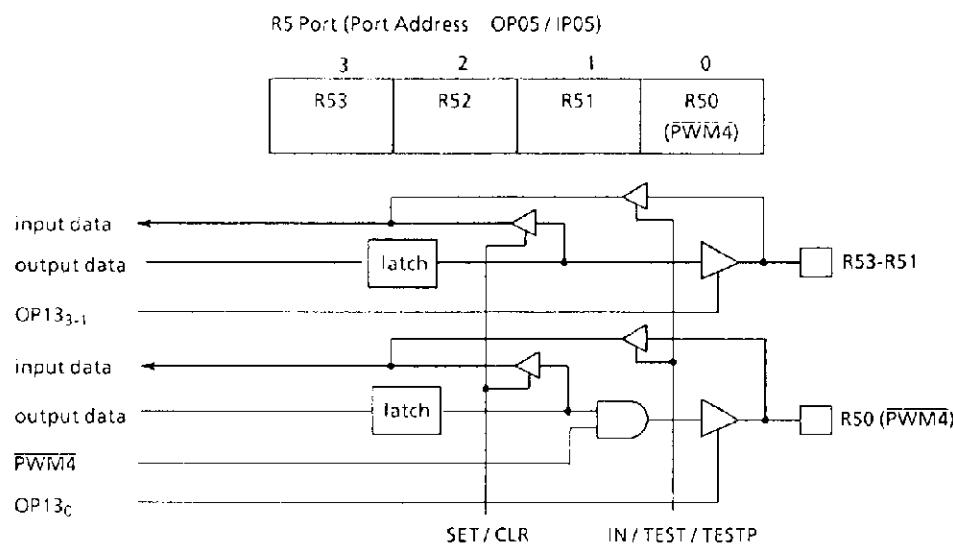

Figure 3-2. Port R5

(3) Port R7 (R73-R70)

The 4-bit I/O port with latch. When used as an input port, the latch should be set to "1". The latch is initialized to "1" during reset. R72, R73 pins is I/O port usually.

Pin R70 (CIN) is shared with the digital input usual and the A/D converter (comparator) input for Auto Frequency Control signal detection. CIN input is comparator input and setting of 3-bit D/A convert for reference voltage are performed by the command register. Pin R71 (WT_O) is shared with the watchdog timer output. R70, R71 pins latch is initialized to "1" during reset, and they are able to use I/O port usually.

Table 3-1. Port Address Assignments and Available I/O Instructions

3.2 On-screen display (OSD) circuit

An on-screen display (OSD) circuit used to display characters and symbols in built into the TV screen. A maximum of 32 characters, as 16 columns × 2 lines, out of 48 character patterns can be displayed at a time.

3.2.1 OSD Circuit Function

① Number of characters	48 kinds
② Number of characters displayed	32 characters (16 columns × 2 lines)
③ Composition of a character	8 × 8 dots (with smoothing function)
④ Size of character	2 kinds (selectable line by line)
⑤ Color of character	7 kinds (selectable character by character)
⑥ Display position variable	horizontal 64 steps, vertical 64 steps

3.2.2 OSD Circuit Configuration

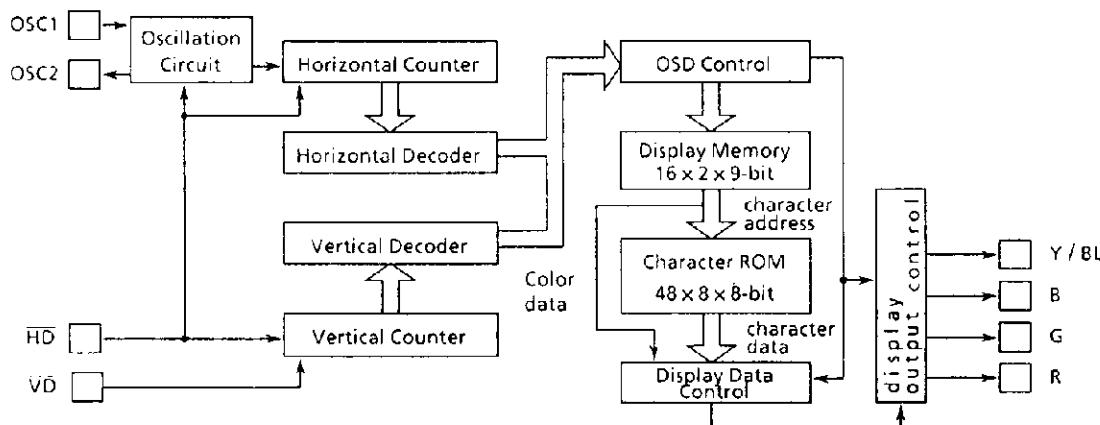

Figure 3-4. OSD Circuit

3.2.3 OSD Circuit Control

The OSD circuit is controlled by the command selector (OP0C) and control register (OP1A). Table 3-2 shows the relationship between OP0C and OP1A. OP1A is multiplexed with the six output control registers which control the display start position, color of character and character size of character, and the two transfer control registers which transfer character data to the display memory.

The output control registers consist of 8 bits and all bits can be written by accessing OP1A two times. However, the second access is not required unless the second data are changed. The addressed "0 to 5" are assigned to the six output control registers. OP1A can be accessed by writing the address of the control register where data are to be changed to OP0C. The transfer control registers can be accessed by writing "6" or "7" to OP0C. The transfer control registers have a 12-bit configuration and can access OP1A three times succession. The first access sets which column is displayed within one line 16 columns. The second and third accesses write 6 bit of character data.

The display memory has a 16-columns × 9-bit × 2 lines configuration with a one-to-one correspondence to the number of columns displayed on the screen. The display data consist of 6 character data bits and 3 color data bits for a total of 9 bits. When "6" is written to OP0C, line 1 is stored to the display memory, when "7" is written to OP0C, line 2 is stored. That is after accessing OP0C, the character data specified the second and third times are written to the display memory area specified in the first OP1A access together with the color data loaded to control register DCR50. Thus color can be specified for each character. After setting of all control registers is completed, the character data read from the character ROM(C0 to 2F_H) are output to the R, G and B pins together with the color data by setting OP0C to "F".

Table 3-2. OSD control commands and control registers

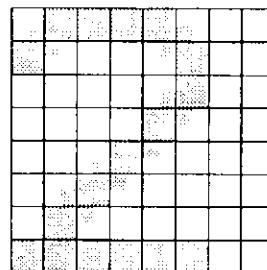

(1) Composition of character and smoothing function

Each character is composed by 8×8 dots. Each dot corresponds to a bit in the character ROM. Figure 3-5. (a) shows an example Composition of a character.

Smoothing function is the function to make characters look smooth. In the time the smoothing function is enabled, additional dots are displayed in the middle of the place where two dots contact each other only at a corner. Controlling of the smoothing function is performed by ESMZ in the OSD control register DCR41. Figure 3-5. (b) shows an example of the smoothing function.

(a) without smoothing

(b) with smoothing

Figure 3-5. Composition of character and smoothing function

(2) Character size and color to display

Size of the characters displayed on screen is selectable line by line from 2 sizes. The size of the first and second display line is designated by CS11-CS10 and CS21-CS20 in the OSD control register DCR40, respectively.

Table 3-3 shows the setting values and character sizes of DCR40.

Table 3-4 shows the display character sizes.

One out of seven colors can be selected for each character to be displayed and are determined by RDT, GDT, and BDT of DCR50. The color data are written to the display memory automatically at the same time as character data are written.

Character size (DCR40)	second display line		first display line	
	CS21	CS20	CS11	CS10
small character	1	0	1	0
large character	0	1	0	1
display OFF	0	0	0	0

Figure 3-3. Designation of character size

	small character	large character
dot size	$2T_{HD} \times 2T_{osc}$	$4T_{HD} \times 4T_{osc}$
character size	$16T_{HD} \times 16T_{osc}$	$32T_{HD} \times 32T_{osc}$

Note. T_{HD} :the period of horizontal synchronous signal

T_{osc} :the period of OSD clock oscillation

Note. Color to display : RGB pin uses Red, Green, Blue such as.

Figure 3-4. character size.

Table 3-5. select of color to display

(3) Display start position

Display start position of each display line on screen can be shifted by software.

The vertical and horizontal display starting position for the first line is determined by HS10 to 15 and VS10 to 15 of DCR00 to 11.

The vertical and horizontal display starting position for the second line is determined by HS20 to 25 and VS20 to 25 of DCR20 to 31. Each has a resolution of 64 steps.

The control register and display line on screen are shown in Table 3-6.

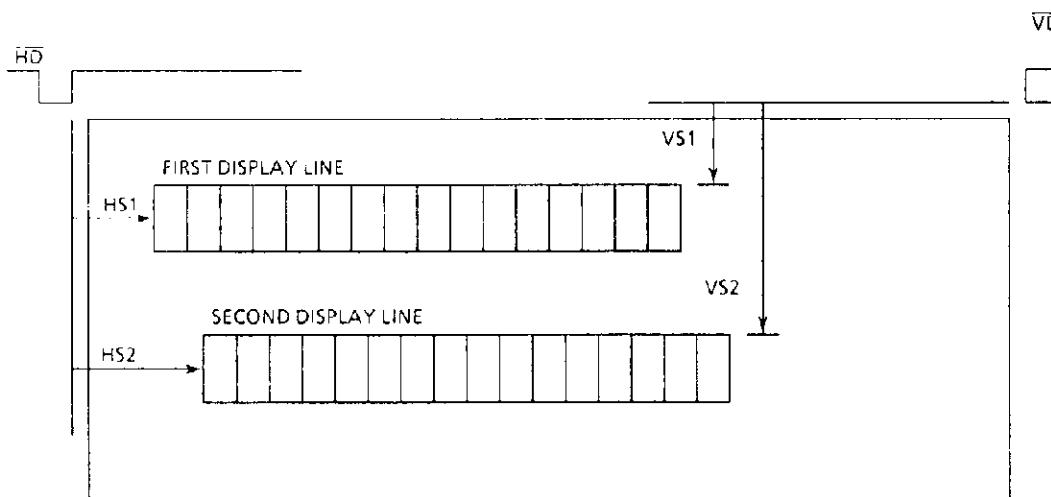

Figure 3-6. TV screen image

SYMBOL	CONTENTS
HS10~HS15	horizontal start position of the first display line $HS1 = ((32 \times HS15 + 16 \times HS14 + 8 \times HS13 + 4 \times HS12 + 2 \times HS11 + HS10) \times 4 + X) T_{osc}$
VS10~VS15	vertical start position of the first display line $VS1 = (32 \times VS15 + 16 \times VS14 + 8 \times VS13 + 4 \times VS12 + 2 \times VS11 + VS10) \times 4 T_{HD}$
HS20~HS25	horizontal start position of the second display line $HS2 = ((32 \times HS25 + 16 \times HS24 + 8 \times HS23 + 4 \times HS22 + 2 \times HS21 + HS20) \times 4 + X) T_{osc}$
VS20~VS25	vertical start position of the second display line $VS2 = (32 \times VS25 + 16 \times VS24 + 8 \times VS23 + 4 \times VS22 + 2 \times VS21 + VS20) \times 4 T_{HD}$

Note. X : X is 17 when small character.
X is 34 when large character.

Table 3-6. Display start position

- * The vertical display positions of lines 1 and 2 can be specified independently but, to prevent overlapping of the two lines on the display, the value for the vertical display position of line 2 must satisfy ($VS2 > VS1 + CS11 \times 16 T_{HD} + CS10 \times 32 T_{HD}$) .

3.2.4 Y/BL signal

The Y signal (the logical or output of the R, G and B signals) makes the display clearer by deleting the background only where characters are displayed. The BL signal deletes the entire background for one character (8×8 dots) and is output for all data except that at address 2FH in the character ROM.

The Y/BL pin is used for both Y signal and BL signal output. Which of the two signals is to be output is determined by the upper 2 bits of OP0A. The dotted lines in Figure 3-7 show the Y/BL signal output being scanned.

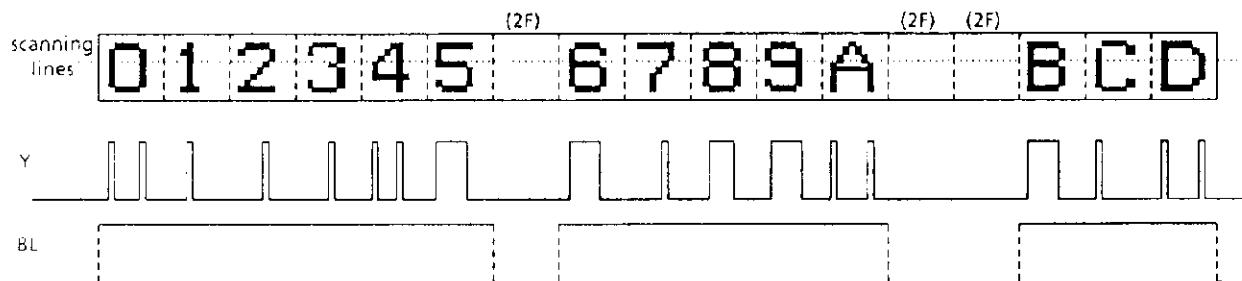

Figure 3-7. Example of Y and BL signal output

3.2.5 Control of OSD outputs buffer

The OSD outputs for Y,BL and RGB use tri-state output buffers for which the respective polarities can be inverted. Polarity is controlled by DRC41 and tri-state is controlled by DRC51.

Bit 3 of DRC41 is used for controlling the smoothing function.

register	bit	symbol	output name	data "0"	data "1"
DRC41	3	ESMZ	—	smoozing OFF	smoozing ON
	2	BLIV	BL	active High	active Low
	1	YIV	Y	active High	active Low
	0	RGBIV	RGB	active High	active Low
DRC51	3	EBF3	Y/BL	output buffer OFF	output buffer ON
	2	EBF2	B	output buffer OFF	output buffer ON
	1	EBF1	G	output buffer OFF	output buffer ON
	0	EBF0	R	output buffer OFF	output buffer ON

Figure 3-7. Control of OSD output

3.2.6 RA Port Function

R signal output and G signal output ports are also used as I/O ports. When not used for color signals, use is possible as normal I/O ports. RA port and Y/BL selection is performed by OP0A.

Also, the upper 2 bits of IP0A are used to input the OSD display status.

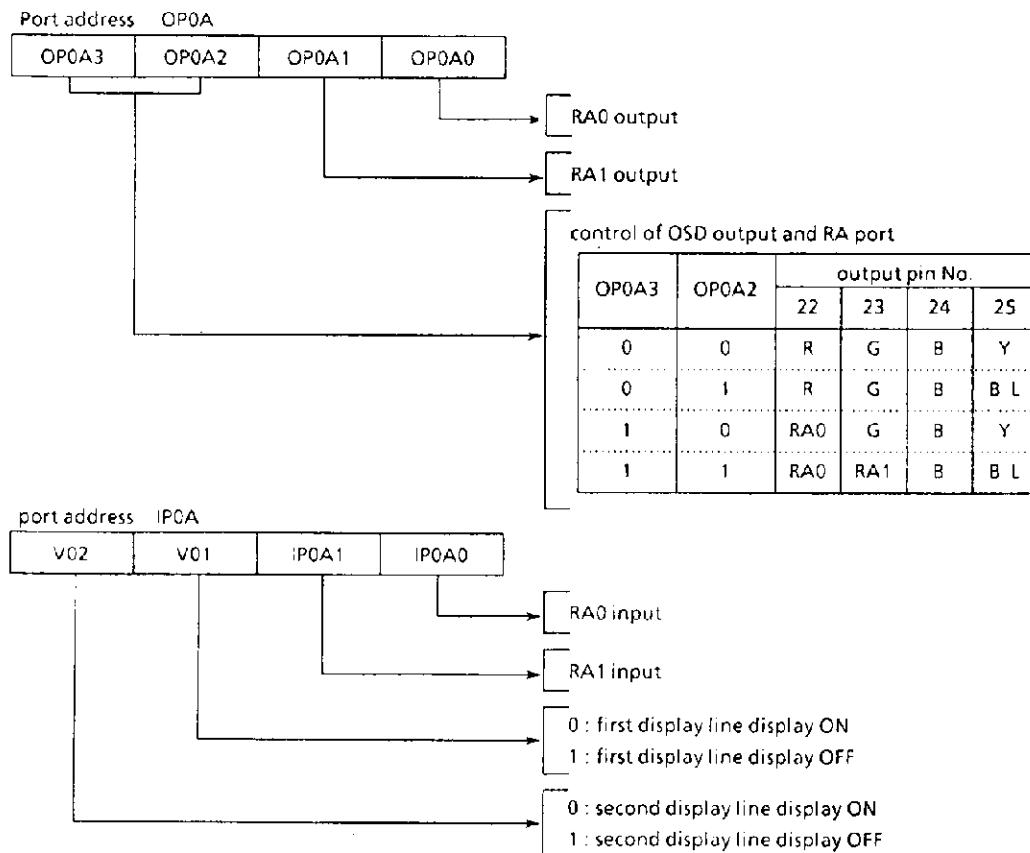

Figure 3-8. Port RA

3.2.7 Character ROM (Standard characters)

Figure 3-9 shows the standard pattern characters and symbols available as character data. Character patterns can also be set by the user. For details, refer to the section on piggyback chip 47C034.

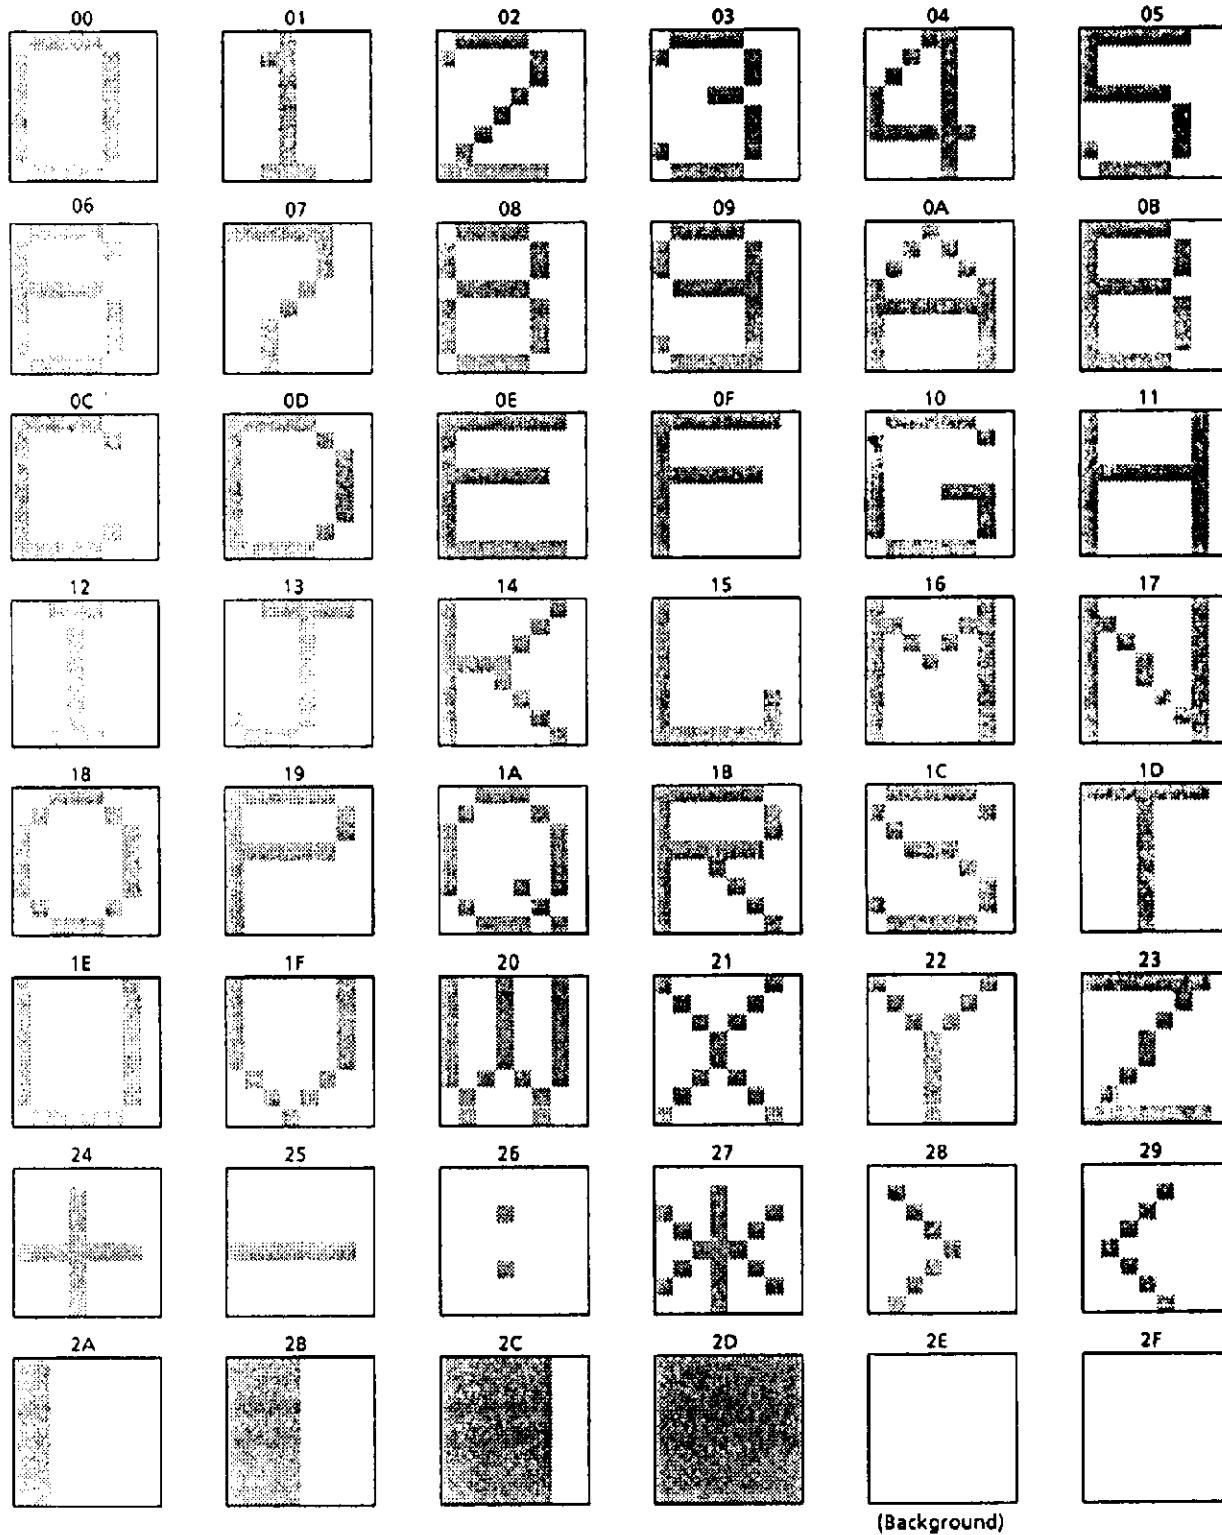

Figure 3-9. Character ROM address and character pattern

3.3 3-bit A/D converter (Comparator) input

Comparator input consists of a comparator and a 3-bit D/A converter. AFC input voltage can be detected in 8 steps by sensing bit 0 of IP07 while changing the reference voltage (D/A converter output voltage) with the command register (OP12).

R70 pin is also used for comparator input. Bit 3 is used to set R70 pin for ordinary digital input.

The comparator is disabled and bit 3 is set to "0" during reset. The latch should be set to "1" when R70 pin is used for comparator input and digital input.

3.3.1 Circuit Configuration

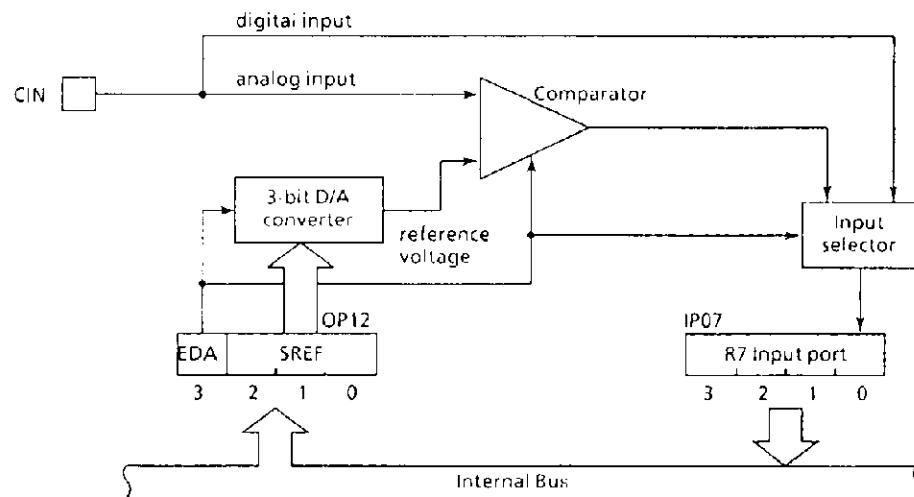

Figure 3-10. Comparator input circuit

3.3.2 Control of Comparator Input

The reference voltage of the comparator is set using the lower 3 bits of the command register. Table 3-8 shows the reference voltage when $V_{DD} = 5V$.

Comparator input control command register (Port address OP12)

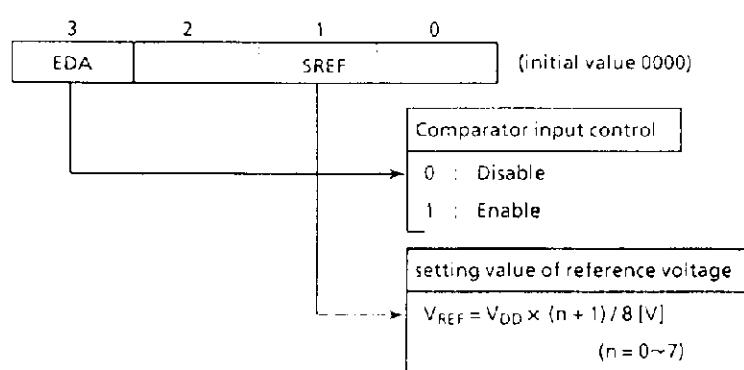

Figure 3-11. Control Command Register

OP12		reference voltage [V]	
2	1	0	
0	0	0	0.62
0	0	1	1.25
0	1	0	1.87
0	1	1	2.50
1	0	0	3.12
1	0	1	3.75
1	1	0	4.37
1	1	1	5.00

Table 3-8. Reference Voltage

3.4 D / A converter (PWM) output

The 47C434/634 have five channels built-in D/A converter (Pulse width Modulation) outputs. PWM output can easily be obtained by connecting an external low pass filter.

PWM outputs data are multiplexed to the R4 port and R50 pin. When the R4 (PWM) port and R50 pin are used for PWM output, the corresponding bits of R4, R50 output latch should be set to "1". The R4, R5 output latch is initialized to "1" during reset.

PWM output is controlled by the buffer selector (OP17) and the data transfer buffer (OP18). PWM data written to the data transfer buffer can be sent to the PWM data latch by writing " C_H " to the buffer selector, and PWM output PWM output. PWM data transferred to the PWM data latch remain intact until overwritten. Resetting and holding clear the buffer selector, data transfer buffer and PWM data latch to "0" (PWM output is "H" level).

3.4.1 Configuration of Pulse Width Modulation circuit

Configuration of pulse width modulation circuit shown in Figure 3-13.

3.4.2 Output waveform of PWM circuit

(1) $\overline{\text{PWM}0}$ output

$\overline{\text{PWM}0}$ is a PWM output controlled by 14 bits data. The basic period of the $\overline{\text{PWM}0}$ is $T_M = 215 / f_c$.

The higher 8 bits of 14 bits data are used to control the pulse width of the pulse output with the period of $T_S = T_M / 64$, which is the sub - period of the $\overline{\text{PWM}0}$. When the 8 bits data are decimal n ($0 \leq n \leq 255$), this pulse width becomes $n \times t_0$, where $t_0 = 2 / f_c$.

The lower 6 bits of 14 bits data are used to control the generation of an additional t_0 wide pulse in each T_S period. When the 6 bits data are decimal m ($0 \leq m \leq 63$), the additional pulse is generated in each of m periods out of 64 periods contained in a T_M period. The relationship between the 6 bits data and the position of T_S period where the additional pulse is generated is shown in Table 3-9.

(2) $\overline{\text{PWM}1}$ - $\overline{\text{PWM}4}$ output

Each of $\overline{\text{PWM}1}$ to $\overline{\text{PWM}4}$ is a PWM output controlled by 6 bits data. The period of them is $T_M = 27 / f_c$. When the 6 bits data are decimal k ($0 < k < 63$), the pulse width becomes $k \times t_0$. The waveform is also illustrated in Figure 3-12.

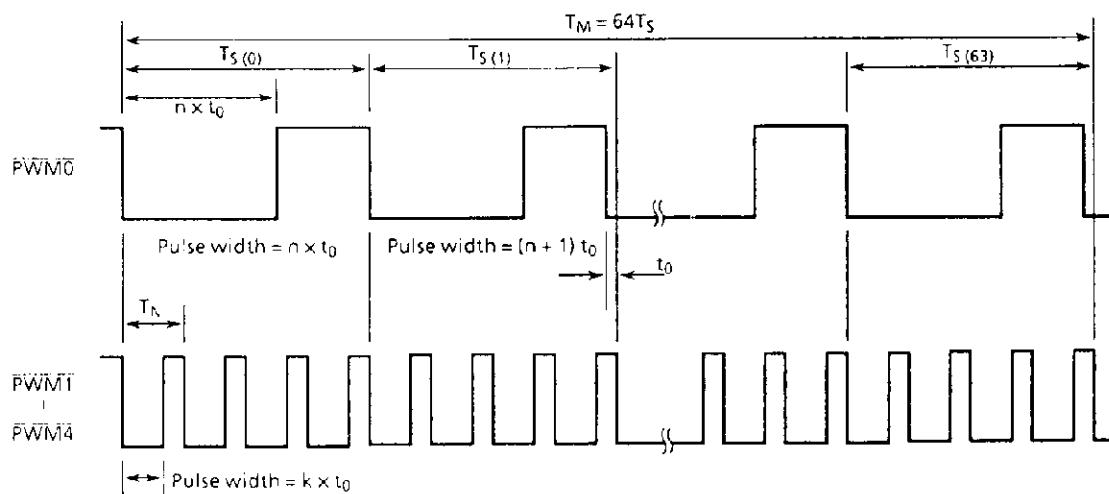

Figure 3-12. PWM Output Waveform (It is shown to the additional pulse $T_S(1)$ and $T_S(63)$ of the $\overline{\text{PWM}0}$)

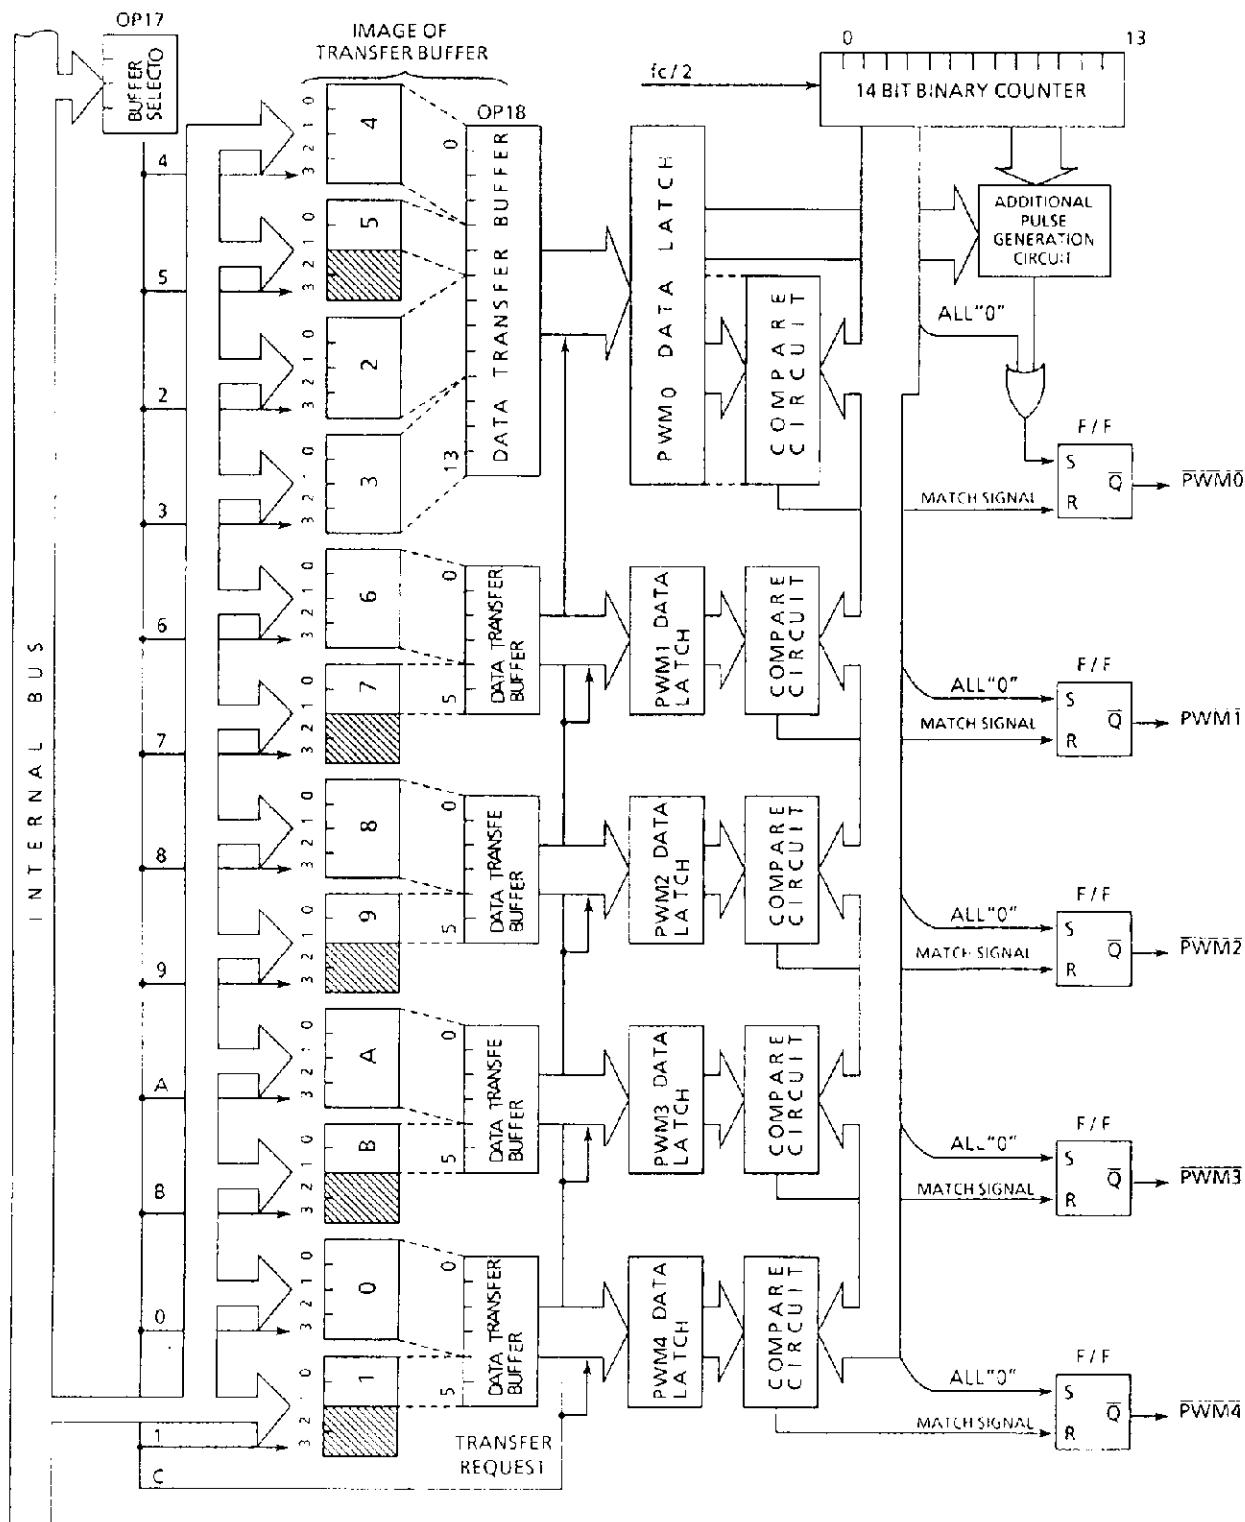

Figure 3-13. Pulse Width Modulation Circuit

Bit position of 6 bits data	Relative position of T_S where the output pulse is generated (No. i of $T_{S(i)}$ is listed)
bit0	32
bit1	16, 48
bit2	8, 24, 40, 56
bit3	4, 12, 20, 28, 36, 44, 52, 60
bit4	2, 6, 10, 14, 18, 22, 26, 30, ..., 58, 62
bit5	1, 3, 5, 7, 9, 11, 13, 15, 17, ..., 59, 61, 63

Note . When the corresponding bit is "1", it is output.

Table 3-9. Correspondence between 6 bits data and the additional pulse generated T_S periods

3.4.3 Control of PWM circuit (Data transfer)

PWM output is controlled by writing output data to a data transfer buffer (OP18). For writing, the output data are divided using the buffer selector (OP17). Buffer numbers are assigned to the data transfer buffers for these divided data, after which the data are written as shown in Table 3-10.

- (1) The number of the transfer buffer to which the data are to be written is written to the buffer selector (OP17).
- (2) The corresponding PWM data are written to the selected buffer (OP18).
- (3) Operations (1) and (2) are repeated, continuously writing data to the transfer buffer.
- (4) When all of the output data have been written, " C_H " is written to the buffer selector.

While the output data are being written to the transfer buffer, the previously written data are being output. For $\overline{P}WM0$ output, switching to $\overline{P}WM$ output occurs at a maximum of $2^{15}/fc$ [sec] (at 4MHz, 8192fs) after " C_H " is written to the buffer selector. For $\overline{P}WM1$ through $\overline{P}WM4$ output data switching, this requires $2^9/fc$ [sec] (at 4MHz, 128μs).

Buffer Number (OP17)	Correspondence to bit (OP18)	Mode	PWM Output
0	Bit of PWM4 transfer buffer	3 ~ 0	Write Preceding data
1	Bit of PWM4 transfer buffer	5 ~ 4	Write Preceding data
2	Bit of PWM0 transfer buffer	9 ~ 6	Write Preceding data
3	Bit of PWM0 transfer buffer	13 ~ 10	Write Preceding data
4	Bit of PWM0 transfer buffer	3 ~ 0	Write Preceding data
5	Bit of PWM0 transfer buffer	5 ~ 4	Write Preceding data
6	Bit of PWM1 transfer buffer	3 ~ 0	Write Preceding data
7	Bit of PWM1 transfer buffer	5 ~ 4	Write Preceding data

CMOS 4-BIT MICROCONTROLLER

TMP47C034E

The 47C034, which is equipped with an EPROM as program memory, is a piggyback type evaluator chip used for development and operational confirmation of the 47C434/634 application systems (programs). Conversion adapter socket BM1105 can be used to convert the 64-pin package of the 47C034 for pin compatibility with the 42-pin mask ROM 47C434/634. Conversion adapter socket BM1106 can be used to convert from 64 pins for pin compatibility with the 54-pin 47C635.

PIN ASSIGNMENT (TOP VIEW)

PIN FUNCTION (Top of the package)

PIN NAME	Input / Output	FUNCTIONS
A13 - A0	Output	Program memory address output
I7 - I0	Input	Program memory data input
CE	Output	Chip enable signal output
OE		Output enable signal output
VCC	Power supply	+ 5V (connected with VDD)
GND		0V (connected with VSS)

NOTES FOR USE

(1) Program memory

Figure 1 shows the program storage area. The 47C034 has a data table at addresses 2000-217FH (48 characters × 16 bits) for on-screen display data so that characters and symbols can be displayed on TV screens. Thus, a 64k EPROM is not used.

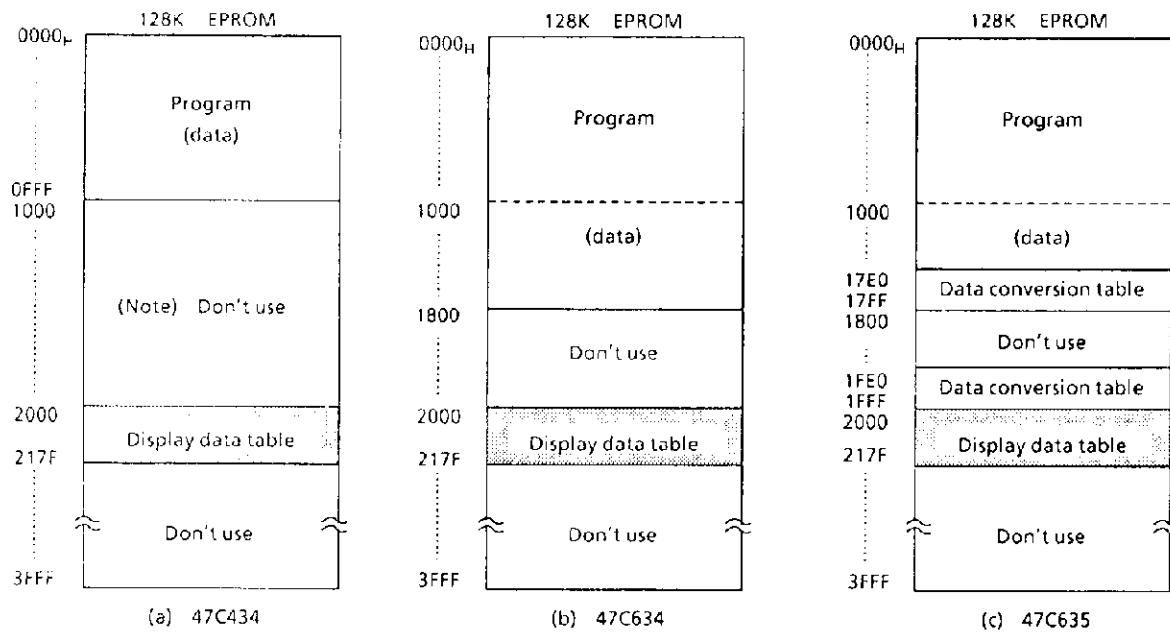

Figure 1. Program area

Note. When using the 47C034 to check 47C635 operation, place data conversion tables at two locations. With the 47C434, permanent data are placed at addresses 0000-0FFFH but, when the 47C034 is used, it is necessary to put the same data that is at addresses 0000-0FFFH at 1000H and following addresses. Also, with the 47C634 and 47C635, the permanent data at addresses 1000-17FFH are read out when the permanent data at addresses 1800-1FFFH are accessed.

(2) Data table for on-screen display (OSD)

With the 47C034, an OSD display character ROM is generated inside the EPROM used. The characters configured using the data loaded to EPROM addresses 2000-217FH are displayed on the TV screen, therefore, characters can be freely set by the user. When a program is being submitted, write the character data to 2000H and the following addresses. Figure 1-2 shows typical character (8 x 8 bits) addresses and data. Figure 1-3 shows a list of standard patterns in hexadecimal.

Figure 2. Typical character

Note. The data area for one character is 8 bytes. The starting address is the value entered at the character ROM address (00-2FH) specified by the upper 6 bits of the 9-bit program area (000-17FH).

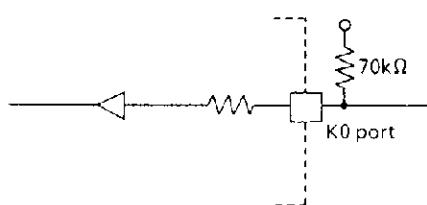

address	data
2000H	00 10 10 10 10 10 10 10 00 00 00 00 00 00 00 00
2001H	00 00 10 00 00 10 00 00 00 00 10 92 54 38 54 92 10
2002H	00 40 20 10 08 10 20 40 00 08 10 20 40 20 10 08
2003H	C0 C0 C0 C0 C0 C0 C0 F0 F0 F0 F0 F0 F0 F0 F0 F0
2004H	FC FC FC FC FC FC FC FF FF FF FF FF FF FF FF FF
2005H	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
2006H	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
2007H	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
2008H	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
2009H	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
200AH	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
200BH	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
200CH	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
200DH	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
200EH	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
200FH	00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00

Figure 3. Standard character data (from address 2000H)

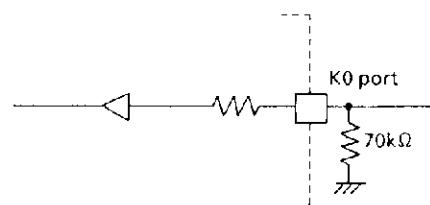

(3) Input/output ports

The input/output circuit for the 47C034 input/output ports is the same as that of the 47C434/634 and 47C635 (code : PC), except that a pulldown resistor is not built into the K0 port.

When using as code PB or PC evaluators, it is necessary to connect an external resistor.

(a) Code : PB

(b) Code : PC

Figure 4. I/O code and external circuitry

Note. The 47C434/634 do not have built-in P1, P2 and R3 ports. Also, the 47C034 pins R40-R43 and R50 form a tristate output buffer; therefore, caution is required when using as the 47C434/634 code PF.
